

PickD — What's new

Friday, August 28, 2026 · everything since the August 27 update · for everyone on the Ludlow floor

The short version

1. Ship: the order card was **laid out again from Rafael's own drawing** — address on one line, photos down the right, every button in the ... menu, and **Print pallet labels** is the first thing in that menu.
2. Ship: the Shipped column always shows the **last 10** and opens the latest one; search brings **5 at a time** instead of 500.
3. Ship: the lithium and PAV-zone banners are now **one pulsing pill** — *Lithium*, *PAV zone*, or *2 alerts* — that opens on a tap.

What you will notice

1. Ship — the card, rebuilt from the floor's own layout

BEFORE

With the Shipped column off the card had 60 % of the screen and used it like a phone: everything stacked in one narrow column, the address broken over two lines by the photo thumbnails beside it, three big buttons at the bottom, a blue Combined Order box repeating what the header says, and the pallet labels printable only by knowing Ctrl+P.

NOW

Rafael dragged the real pieces of the card into place on a layout board — one version for the phone, one for the 60 % screen — and the card is built exactly that way. Nothing new to learn: the same numbers, the same copy buttons, in the places he put them.

WHERE	NOW
Header	One line: the full order numbers, carrier logo, the note, the date, and the photo tile. Tap the note and the whole note history opens.
Address	Street and city on one line , ZIP right beside it — each with its copy button. On a phone the ZIP drops under it.
Carrier	Label, carriers and the load # on one line, all at the height of the carrier chips; when Daylight is the carrier, the "text the dispatcher" reminder sits on that same line.
Photos	A strip down the right edge , one thumbnail per photo — as many as there are. The tile in the header takes another or opens them all.
... menu	Print pallet labels first (the most used; Ctrl+P still works), then Print packing slip, Picking Summary, Edit, Notes, Combine / Split / Uncombine, the lithium label manual on FedEx orders, Reopen, and Delete last.
Lithium banner	FedEx orders only — on a truck order the e-bike row under the numbers is the declaration.

881303 / 881301

LBS

Live on August 28, order 881303 / 881301 with the Shipped column off: the header on one line with the full numbers, the note, the date and the photo tile; the address and ZIP together; the carrier row with its label, the carriers that fit and the load # at the end of it; the four numbers and the e-bike row; the two pallet photos down the right edge.

The same order on a phone, from Rafael's second drawing: the photos keep their column, the ZIP drops under the address, and the carrier row shows the chosen carrier plus

Left: the ... menu on order 881303 / 881301 — **Print pallet labels** first, Delete last; Split, Uncombine and the lithium manual appear only on the orders they apply to. Right: the same order on August 27, before — one narrow column, buttons at the bottom, the Combined Order box.

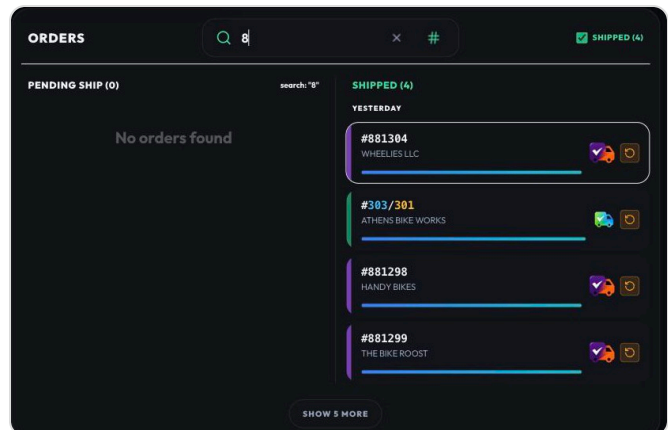

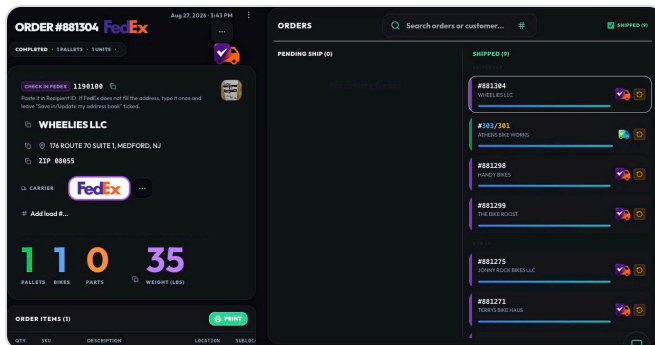

2. Ship — the Shipped column is never empty, and search is light

BEFORE

The Shipped column only showed orders shipped *today* — since July. First thing in the morning it was empty, nothing was selected, and the last order shipped the day before was one search away. And that search was heavy: typing a single "8" pulled up to 500 orders.

NOW

The column always holds the **last 10 shipped**, grouped by day (Today / Yesterday / the date), and with nothing pending the **most recently shipped order opens by itself**. Search brings the **five newest matches** and a *Show 5 more* button — and an exact order number is always found, however old.

Left: Ship first thing on August 28 — nothing pending, the Shipped column lists **Yesterday** and **Aug 26**, and 881304 is already open. Right: typing **8** brings the five newest matches (881303 / 881301 count as one) and *Show 5 more*; before, the same keystroke fetched 500 orders.

3. Ship — alerts in one pill

Instead of full-size banners stacked on the card, one small pulsing pill at the right of the customer name says what there is — **Lithium** on a FedEx order with an e-bike, **PAV zone** on a truck order outside PAV's area, or **2 alerts** — and a tap opens the instructions. The Daylight "text the dispatcher" reminder stays where it is, in the carrier row.

Mentioned only, so you know it happened

- The layout board itself (every piece of the card draggable, no padding, group and split) stays around for the next screen that needs rearranging.

Coming up

- Ship: one pulsing button for the lithium / carton alerts instead of banners (waiting on wording).
- Opening a completed order from the Board goes straight to its Picking Summary.

- Assist mode in Double Check: two people on one multi-pallet order.
